Sample Question Analysis from the 2013 Paper

Example Question:

The graph shows the effect of temperature on enzyme activity. Describe the trend shown and explain why enzyme activity decreases at high temperatures.

Expert Explanation:

The graph demonstrates that enzyme activity increases with temperature up to an optimum point, after which it declines sharply. This trend indicates that enzymes are more active at higher temperatures due to increased kinetic energy, resulting in more frequent collisions with substrate molecules. However, beyond the optimum temperature, enzymes begin to denature, losing their

specific shape?and thus their activity decreases. The sharp decline reflects the loss of enzyme function due to denaturation at elevated temperatures.

Key Points in Answer:

- Identification of the increasing trend up to the optimum point.
- Explanation of kinetic energy and collision frequency.
- Clarification of enzyme denaturation at high temperatures.
- Use of technical terms like ?denaturation,? ?active site,? and ?kinetic energy? enhances clarity.
