Review answer:

- Molar mass = sum of atomic masses of all atoms in the compound, expressed in g/mol.

3. Mass and Weight

- Mass refers to the amount of matter in a substance, measured in grams (g) or kilograms (kg).
- Weight is the force exerted by gravity on a mass; in chemistry, mass is commonly used, while weight is more relevant in physics.

Review answer:

- Mass is the measure of matter, typically in grams in chemistry context.

4. Volume

The space occupied by a substance. Common units include liters (L), milliliters (mL), and cubic centimeters (cm³).

Review answer:

- Volume measures the space an object or substance occupies, usually in liters or milliliters.

5. Concentration

Concentration describes how much solute is dissolved in a solvent, often expressed as:

- Molarity (M): moles of solute per liter of solution.
- Mass percent: grams of solute per 100 grams of solution.

- Molality (m): moles of solute per kilogram of solvent.

Review answer:

- Concentration indicates the amount of solute in a given volume or mass of solution.

6. Percentage Composition

The percentage by mass of each element in a compound. It is calculated using the formula:

$$\%$$

$$\% \text{ element} = \left(\frac{\text{mass of element in 1 mol of compound}}{\text{molar mass of compound}} \right) \times 100$$

$$\%$$

Review answer:

- Percentage composition shows the proportion of each element in a compound by mass.

- Empirical formula: The simplest whole-number ratio of elements in a compound.
- Molecular formula: The actual number of atoms of each element in a molecule, which may be a multiple of the empirical formula.

Review answer:

- Empirical formula provides the simplest ratio; molecular formula shows the actual number of atoms.

Reviewing Key Vocabulary with Practice Questions and Answers

To reinforce understanding, let's review some typical questions and their answers related to chemical quantities.

1. How do you determine the molar mass of a compound?

Answer:

Sum the atomic masses of all atoms in the molecular or formula unit. For example, for water (H₂O):

- Hydrogen: 1.008 g/mol
- Oxygen: 16.00 g/mol
- Molar mass of H₂O = (2 x 1.008) + 16.00 = 18.016 g/mol

2. What is the significance of Avogadro's number?

Answer:

It provides a link between the microscopic scale (particles) and the macroscopic scale (grams, liters). One mole of any substance contains 6.022×10^{23} particles.

3. How do you calculate the number of moles from mass?

Answer:

Use the formula:

$$\text{Moles} = \frac{\text{Mass (g)}}{\text{Molar mass (g/mol)}}$$

4. How is molarity defined? Provide the formula.

Answer:

Molarity (M) = moles of solute / liters of solution.

$$M = \frac{\text{moles of solute}}{\text{volume of solution in liters}}$$

5. How do you find the empirical formula of a compound?

Answer:

- Convert the mass of each element to moles.
- Divide each mole value by the smallest number of moles.
- Round to the nearest whole number ratio.
- Write the empirical formula based on these ratios.

Common Calculations Using Chemical Quantities Vocabulary

1. Converting between mass and moles

- To convert from mass to moles: divide the mass by molar mass.
- To convert from moles to mass: multiply the number of moles by molar mass.

2. Calculating the number of particles

- Use the number of moles and multiply by Avogadro's number.

$$\text{Number of particles} = \text{moles} \times 6.022 \times 10^{23}$$

3. Determining concentration

- For molarity: divide moles of solute by liters of solution.
- For mass percent: divide the mass of solute by the total mass of solution and multiply by 100.

Common Mistakes and Tips in Chemical Quantities Vocabulary

- Always double-check units when performing calculations.
