Function:

- Facilitates the transfer or disengagement of power to the front wheels.
- Ensures positive locking when engaged.

- Hub Clutch Assembly

This component is responsible for transmitting torque from the axle to the wheel when locked. It contains friction surfaces and rollers that lock or release based on the position of the cam plate.

Function:

- Provides smooth engagement/disengagement.
- Maintains a secure connection during 4WD operation.

- Engagement Pins

Small metal pins that physically lock the hub to the axle when engaged. They are moved into position by the rotation of the cam plate or locking ring.

Function:

- Secure the hub in the engaged position.
- Prevent slippage during 4WD use.

- Locking Mechanism (Lever or Knob)

The driver manually operates this component, turning it clockwise or counterclockwise to lock or unlock the hubs. On the 1984 Ford F250, this is typically a rotary knob located on the wheel hub.

Function:
