Sample Bio Pozos Final Exam Questions and Answers

Below are sample questions and their detailed answers to illustrate the types of questions you may encounter.

Question 1: Describe the process of photosynthesis.

Answer:

Photosynthesis is the process by which green plants, algae, and some bacteria convert light energy into chemical energy stored in glucose molecules. It occurs mainly in the chloroplasts of plant cells and involves two main stages: the light-dependent reactions and the light-independent reactions (Calvin cycle).

- Light-dependent reactions: These take place in the thylakoid membranes and require sunlight. Chlorophyll absorbs light energy, which excites electrons. Water molecules are split (photolysis), releasing oxygen, protons, and electrons. The energy from excited electrons is used to generate ATP and NADPH.

- Light-independent reactions (Calvin cycle): These occur in the stroma. ATP and NADPH produced in the previous stage provide energy to convert carbon dioxide into glucose through a series of enzyme-driven steps.

Overall, the simplified equation for photosynthesis is:

Question 2: Explain Mendel's Law of Segregation.

Answer:

Mendel's Law of Segregation states that during the formation of gametes (sperm and egg), the two alleles for a trait separate or segregate from each other. This means each gamete carries only one allele for each gene. When fertilization occurs, the offspring inherits one allele from each parent, restoring the pair.

This law explains the inheritance patterns observed in Mendel's experiments with pea plants, where traits such as seed color or shape showed predictable ratios in the offspring. The segregation is due to the separation of homologous chromosomes during meiosis, ensuring genetic diversity and predictable inheritance patterns.
