Examples of Thermodynamics Van Wylen 7th Exercises Solutions

Below, we present detailed solutions to representative exercises, illustrating the step-by-step approach.

Example 1: Work Done in an Isothermal Expansion of an Ideal Gas

Problem Statement:

An ideal gas undergoes an isothermal expansion at 300 K from an initial volume of 1 m^3 to a final volume of 3 m^3. Calculate the work done by the gas during this process.

Solution:

Step 1: Identify Known Data

- Temperature, T = 300 K
- Initial volume, V? = 1 m^3
- Final volume, V? = 3 m^3
- Ideal gas constant, R = 8.314 kJ/kmol·K (or use specific gas constant depending on the gas)

Step 2: Determine the Gas Constant for the Gas

Assuming the gas is air with molar mass M ? 28.97 g/mol, the specific gas constant:

$R_{specific} = R / M ? 8.314 / 0.02897 ? 287$ J/kg·K

Step 3: Apply the Work Formula for Isothermal Process

For an ideal gas undergoing an isothermal process:

$$ W = nRT \ln \frac{V_2}{V_1} $$

Alternatively, using specific quantities:

$$ W = m R_{specific} T \ln \frac{V_2}{V_1} $$

Assuming unit mass (m=1 kg):

$$ W = 1 \times 287 \times 300 \times \ln(3/1) $$

Calculating:

$$ W ? 287 \times 300 \times 1.0986 ? 287 \times 329.58 ? 94,675 \text{ J} $$

Answer:

The work done by the gas is approximately 94.7 kJ.

Step 4: Final Verification

- The work is positive, indicating work done by the gas during expansion.
- Units are consistent.
- The result aligns with thermodynamic principles for isothermal expansion.

Example 2: Entropy Change in a Heating Process

Problem Statement:

A 2 kg block of water is heated from 20°C to 100°C in a constant pressure process. The specific heat capacity of water is 4.18 kJ/kg·K. Calculate the entropy change of the water.

Solution:

Step 1: Convert Temperatures to Kelvin

- T_1 = 20°C = 293.15 K
- T_2 = 100°C = 373.15 K

Step 2: Use the Entropy Change Formula for a Reversible Heating Process

$$\Delta S = m c_p \ln \frac{T_2}{T_1}$$

Step 3: Substitute Values

$$\Delta S = 2 \times 4.18 \times \ln \frac{373.15}{293.15}$$

Calculate the logarithm:

$$\ln \left(\frac{373.15}{293.15} \right) ? \ln(1.273) ? 0.241$$

Now, compute:

$$\Delta S ? 2 \times 4.18 \times 0.241 ? 2 \times 1.007 ? 2.014 \text{ kJ/K}$$

Answer:

The entropy of the water increases by approximately 2.01 kJ/K.

problem-solving mindset.

Use of Visual Aids and Annotations

Solutions often include:

- Diagrams and sketches to conceptualize the system.
- Annotated equations highlighting assumptions or simplifications.
- Flowcharts illustrating the logical progression.

Such aids enhance understanding, especially for visual learners, and make complex procedures more digestible.

Emphasis on Conceptual Clarity

In addition to numerical solutions, solutions often explain:

- Why particular laws are applied.
- The reasoning behind choosing specific process models.
- Common pitfalls and how to avoid them.

This pedagogical focus ensures learners develop both problem-solving skills and thermodynamic intuition.

Examples of Typical Exercises and Their Solutions

To illustrate the depth and utility of Van Wylen?s solutions, let?s consider an example exercise typical for the textbook, along with an overview of its comprehensive solution.

Example Exercise: Isentropic Expansion of an Ideal Gas

Problem Statement:

A piston-cylinder device contains 0.5 kg of an ideal gas initially at 300 K and 200 kPa. The gas undergoes an isentropic expansion to a final pressure of 100 kPa. Determine:

a) The final temperature of the gas.

b) The work done during the process.

Step 1: Restate Known Data and Find Unknowns

- Initial state:
- $P_1 = 200\, \text{kPa}$
- $T_1 = 300\, \text{K}$
- $m = 0.5\, \text{kg}$

- Final pressure:
- $P_2 = 100\, \text{kPa}$

- Unknowns:
- T_2: Final temperature.
- W_{12}: Work done by the gas.

Step 2: Recognize the Process Type

- Isentropic expansion of an ideal gas suggests:

$$
PV^\gamma = \text{constant} \quad \text{or} \quad T P^{1-\gamma} = \text{constant}
$$

where γ is the specific heat ratio.

Step 3: Calculate Final Temperature T_2

Using the relation:

$$
\frac{T_2}{T_1} = \left(\frac{P_2}{P_1}\right)^{(\gamma - 1)/\gamma}
$$

Assuming the gas is air, $\gamma = 1.4$.

Calculations:

$$
T_2 = 300\, \text{K} \times \left(\frac{100}{200}\right)^{(0.4/1.4)} = 300\, \text{K} \times (0.5)^{0.2857}
$$

$$
T_2 \approx 300\, \text{K} \times 0.814 = 244.2\, \text{K}
$$

Result: The final temperature is approximately 244.2 K.

Step 4: Calculate Work Done W_{12}

For an ideal gas undergoing an isentropic process:

$$
W_{12} = m R (T_1 - T_2)
$$

Where:

- R = specific gas constant for air $\approx 0.287\, \text{kJ/kg·K}$.

Calculations:

$$
W_{12} = 0.5\, \text{kg} \times 0.287\, \text{kJ/kg·K} \times (300\, \text{K} - 244.2\, \text{K}) \approx 0.5 \times 0.287 \times 55.8
$$

$$

$$W_{12} \approx 0.5 \times 16.02 = 8.01\, \text{kJ}$$

Result: The work done by the gas during expansion is approximately 8.01 kJ.

Step 5: Verify and Interpret Results

- The temperature decrease aligns with the expectation for expansion.
- The work value makes physical sense for the given mass and conditions.

How the Solutions Enhance Learning

This example demonstrates several key advantages of Van Wylen?s detailed solutions:

- Clarity in stepwise reasoning: Each step logically follows from the previous, reinforcing problem-solving methodology.
- Explicit assumptions: Use of ideal gas law and isentropic relations are justified and explained.
- Calculation transparency: All equations and numerical steps are shown, allowing learners to follow and replicate.
- Conceptual insights: The solution elucidates how pressure, temperature, and work relate in idealized processes.

QuestionAnswer What are common strategies for solving exercises from Van Wylen's Thermodynamics 7th edition? Common strategies include carefully analyzing the problem statement, identifying known and unknown variables, applying the appropriate thermodynamic laws (such as conservation of energy or entropy), and utilizing standard tables and charts provided in the textbook. Breaking down complex problems into smaller parts and checking units consistently also helps achieve accurate solutions. How can I effectively use the tables and charts in Van Wylen's Thermodynamics when solving exercises? To effectively use tables and charts, first identify the property you need (e.g., specific volume, enthalpy, entropy) and locate the corresponding data for the given state. Ensure your state points fall within the correct temperature and pressure ranges. Use interpolation if necessary and cross-reference multiple tables to verify consistency before proceeding with calculations. What are common mistakes to avoid when working through Van Wylen's thermodynamics exercises? Common mistakes include misreading the problem statement, mixing up units, neglecting to verify the initial and boundary conditions, and incorrectly applying thermodynamic equations. Also, avoid overlooking phase changes or assuming ideal behavior when real fluid properties are necessary. Double-check calculations and units at each step to minimize errors. Are there specific exercises in Van Wylen's Thermodynamics 7th edition that are particularly challenging for students? Yes, exercises involving Rankine cycles, refrigeration cycles, and entropy calculations often pose challenges due to their multi-step nature and the need for careful analysis of cycle processes.
