Question What are the key indications for performing a thyroidectomy in ENT head and neck surgery? Thyroidectomy is indicated for benign nodules causing compressive symptoms, malignant thyroid tumors, Graves' disease unresponsive to medical therapy, and suspicious or confirmed thyroid cancers requiring surgical removal. How is a parotid gland tumor typically approached surgically? The standard approach is a superficial parotidectomy, which involves careful facial nerve preservation, with the extent of resection tailored to tumor size and location. Malignant tumors may necessitate total parotidectomy with potential neck dissection. What are essential steps in performing a functional neck dissection? A functional neck dissection involves removal of lymphatic tissue in specific neck levels (I-V), while preserving non-lymphatic structures such as the spinal accessory nerve, internal jugular vein, and sternocleidomastoid muscle to maintain function. When is a laryngectomy indicated in head and neck surgery? Laryngectomy is indicated for advanced laryngeal cancers not amenable to organ-preserving methods, recurrent tumors after radiation, or invasion of the laryngeal framework or extralaryngeal tissues, to achieve complete tumor removal. What are common complications associated with head and neck surgeries, and how are they managed? Common complications include nerve injury (e.g., facial nerve palsy), hematoma, infection, fistula formation, and airway compromise. Management involves prompt recognition, supportive care, surgical revision if needed, and multidisciplinary follow-up. How does intraoperative nerve monitoring benefit head and neck surgeries? Intraoperative nerve monitoring helps identify and preserve critical nerves such as the facial, vagus, and recurrent laryngeal nerves, reducing postoperative nerve deficits and improving surgical safety. What are the essential preoperative assessments for patients undergoing ENT head and neck procedures? Preoperative assessments include detailed history and physical examination, imaging studies (CT, MRI), airway evaluation, laboratory tests, and in some cases, biopsy to confirm malignancy, ensuring surgical planning and patient safety.
