Common MCQs in Medical Parasitology with Answers

The following sections present frequently encountered MCQs, categorized by parasite groups, along with detailed explanations.

Protozoan Parasites

Q1. Which of the following protozoa is responsible for causing amoebic dysentery?

- A) Giardia lamblia
- B) Entamoeba histolytica
- C) Trichomonas vaginalis
- D) Cryptosporidium parvum

Answer: B) Entamoeba histolytica

Explanation:

Entamoeba histolytica is the causative agent of amoebic dysentery, characterized by diarrhea with blood and mucus. It infects the large intestine, leading to mucosal ulceration. Giardia lamblia causes giardiasis, which presents with watery diarrhea but typically not dysentery. Trichomonas vaginalis causes urogenital infections, and Cryptosporidium is associated with diarrheal illness, especially in immunocompromised hosts, but not classic amoebic dysentery.

Q2. Which diagnostic method is most commonly used to identify Giardia lamblia in stool samples?

- A) Acid-fast staining
- B) Direct microscopy with iodine stain
- C) Serological testing
- D) Blood smear

Answer: B) Direct microscopy with iodine stain

Explanation:

Giardia lamblia trophozoites and cysts are identified via microscopy after concentration techniques and iodine staining. The characteristic pear-shaped trophozoites with flagella and the cyst form are visualized. Acid-fast stains are not typically used for Giardia, serology is adjunctive, and blood smears are not diagnostic for intestinal protozoa.

Helminthic Parasites

Q3. The eggs of Ascaris lumbricoides are typically identified by their:

- A) Smooth shell with a mammillated surface
- B) Thick shell with bipolar plugs
- C) Ovoid shape with a striated shell
- D) Spherical shape with a smooth shell

Answer: B) Thick shell with bipolar plugs

Explanation:

Ascaris lumbricoides eggs are large, oval, and feature characteristic thick shells with bipolar plugs?specialized structures at each pole. These features are distinctive under microscopy. The other options describe eggs of different parasites, such as *Trichuris trichiura* (operculated eggs) and *Schistosoma* spp.

Q4. Which of the following is a common clinical feature of hookworm infection?

- A) Severe anemia
- B) Jaundice
- C) Ascites
- D) Hematuria

Answer: A) Severe anemia

Explanation:

Hookworms (*Ancylostoma duodenale* and *Necator americanus*) attach to intestinal mucosa, feeding on blood, which can lead to iron-deficiency anemia. Symptoms include fatigue, pallor, and in heavy infections, significant anemia. Jaundice and ascites are not typical features, and hematuria is characteristic of urinary schistosomiasis.

Flukes and Tapeworms

Q5. The intermediate host for *Schistosoma mansoni* is:

- A) Freshwater snail

B) Fish

C) Mosquito

D) Crab

Answer: A) Freshwater snail

Explanation:

Schistosoma mansoni's lifecycle involves freshwater snails of the genus *Biomphalaria* as intermediate hosts. Miracidia develop into cercariae within these snails, which then infect humans via skin penetration. Fish, mosquitoes, and crabs are not involved in this lifecycle.

Q6. Which tapeworm species is associated with cysticercosis in humans?

A) *Taenia saginata*

B) *Taenia solium*

C) *Diphyllobothrium latum*

D) *Hymenolepis nana*

Answer: B) *Taenia solium*

Explanation:

Taenia solium, the pork tapeworm, can cause cysticercosis when humans ingest eggs shed in contaminated food or water, leading to larval cyst formation in tissues. *Taenia saginata* infects cattle and humans but does not cause cysticercosis. *Diphyllobothrium latum* is a fish tapeworm, and *Hymenolepis nana* causes dwarf tapeworm infection but is not linked to cysticercosis.

Diagnostic Techniques and Laboratory Investigation

A) Thick and thin blood smears stained with Giemsa stain

B) Stool microscopy

C) Urinalysis

D) Urinary antigen test

Answer: A) Thick and thin blood smears stained with Giemsa stain

Explanation:

Malaria diagnosis relies primarily on microscopic examination of blood smears stained with Giemsa, allowing visualization of Plasmodium species, their developmental stages, and parasitemia levels. Stool microscopy is used for intestinal parasites, and urinary tests are not diagnostic for malaria.

Q8. Which molecular technique is considered the gold standard for detecting parasitic DNA in clinical samples?

A) ELISA

B) Polymerase Chain Reaction (PCR)

C) Western blot

D) Rapid diagnostic tests (RDTs)

Answer: B) Polymerase Chain Reaction (PCR)

Explanation:

PCR offers high sensitivity and specificity for detecting parasite DNA, making it the gold standard in molecular diagnostics. ELISA and RDTs are useful but may have limitations in sensitivity or cross-reactivity.

Treatment and Prevention MCQs

Q9. Which antiparasitic drug is primarily used to treat toxoplasmosis?

A) Metronidazole

B) Pyrimethamine with sulfadiazine

C) Albendazole

D) Praziquantel

Answer: B) Pyrimethamine with sulfadiazine

Explanation:

Toxoplasmosis, caused by *Toxoplasma gondii*, is treated with pyrimethamine combined with sulfadiazine, often with folinic acid to reduce hematologic toxicity. Metronidazole is used for amoebiasis and giardiasis, albendazole for various helminths, and praziquantel for schistosomiasis and tapeworms.

Q10. Which public health measure is most effective in preventing schistosomiasis?

A) Boiling drinking water

B) Vector control measures

C) Avoiding contact with freshwater bodies infested with cercariae

D) Use of insecticide-treated bed nets

Answer: C) Avoiding contact with freshwater bodies infested with cercariae

Explanation:

Schistosomiasis transmission occurs when skin contacts freshwater contaminated with cercariae released from infected snails. Avoiding such contact is crucial. Boiling water prevents other waterborne diseases, vector control targets mosquito-borne illnesses, and bed nets are primarily for malaria prevention.
