To aid students in their study journey, this article compiles typical MANEB MSCE questions on physical science, along with clear, concise answers. These questions are representative of the types of problems students may encounter during their exams, offering practice and confidence-building.

Common Physical Science MSCE MANEB Questions and Detailed Answers

1. Basic Concepts in Physics

Q1: Define force and state its SI unit.

A:

Force is a push or pull that causes an object to accelerate, change direction, or deform. It is a vector quantity, meaning it has both magnitude and direction. The SI unit of force is the Newton (N), where

1 Newton is the force required to accelerate a 1 kg mass by 1 m/s².

Q2: What is Newton's Second Law of Motion?

A:

Newton's Second Law states that the acceleration of an object is directly proportional to the net force acting on it and inversely proportional to its mass. Mathematically, it is expressed as:

$$F = ma$$

where:

- F is the net force (in Newtons)
- m is the mass of the object (in kilograms)
- a is the acceleration (in meters per second squared)

Q3: Explain the concept of inertia.

A:

Inertia is the tendency of an object to resist changes to its state of motion or rest. It is directly related to mass; the greater the mass, the greater the inertia. This means heavier objects require more force to start moving or to stop once in motion.

2. Properties of Matter

Q4: Differentiate between mass and weight.

A:

- Mass is the amount of matter in an object, measured in kilograms (kg) or grams (g). It is a scalar quantity and remains constant regardless of location.
- Weight is the force exerted on an object due to gravity, measured in Newtons (N). It varies with the strength of the gravitational field and can be calculated as:

$$W = mg$$

where g is the acceleration due to gravity (approximately 9.8 m/s² on Earth).

Q5: Describe the main states of matter.

A:

Matter exists primarily in three states:

- Solid: Fixed shape and volume; particles are tightly packed and vibrate in fixed positions.
- Liquid: Fixed volume but indefinite shape; particles are close but can move past each other.
- Gas: Indefinite shape and volume; particles are far apart and move freely.

3. Energy and Work

Q6: Define work in physics and give its SI unit.

A:

Work is done when a force causes an object to move in the direction of the applied force. It is calculated as:

$$W = Fd \cos \theta$$

where:

- F is the force applied
- d is the displacement
- θ is the angle between force and displacement

The SI unit of work is the Joule (J), where 1 Joule equals 1 Newton meter.

Q7: What are different forms of energy?

A:

Energy exists in various forms, including:

- Kinetic Energy: Energy possessed by a moving object.
- Potential Energy: Stored energy due to position or configuration.
- Thermal Energy: Heat energy resulting from particle motion.

- Electrical Energy: Energy due to electric charges.
- Chemical Energy: Stored in chemical bonds.
- Nuclear Energy: Released during nuclear reactions.

4. Laws of Motion and Mechanics

Q8: State and explain the First Law of Motion.

A:

The First Law, also known as the Law of Inertia, states that an object at rest stays at rest, and an object in motion stays in motion at a constant velocity unless acted upon by an external force. This law emphasizes the resistance of objects to changes in their state of motion.

Q9: Describe the concept of momentum.

A:

Momentum is the product of an object's mass and its velocity:

$$p = mv$$

It is a vector quantity, meaning it has both magnitude and direction. Momentum is conserved in a closed system, meaning the total momentum before and after an interaction remains constant.

5. Chemical Principles

Q10: Define an atom and a molecule.

A:

- An atom is the smallest unit of an element that retains its chemical properties.
- A molecule consists of two or more atoms chemically bonded together. Molecules can be elements (like O₂) or compounds (like H₂O).

Q11: What is a chemical reaction?

A:

A chemical reaction involves the rearrangement of atoms to form new substances. It is usually

represented by a chemical equation. For example:

Q12: Explain the concept of acids and bases.

A:

- Acids are substances that release hydrogen ions (H^+) in solution and have a pH less than 7. Examples include lemon juice and vinegar.
- Bases release hydroxide ions (OH^-) and have a pH greater than 7. Examples include soap and baking soda.

The pH scale measures acidity or alkalinity.

Sample Questions and Detailed Answers

- Matter and Its Properties

Question:

Describe the differences between solids, liquids, and gases in terms of particle arrangement and movement.

Answer:

Solids, liquids, and gases are the three main states of matter, distinguished primarily by their particle arrangement and movement:

- Solids:

- Particle arrangement: Particles are tightly packed in a fixed, orderly arrangement.
- Movement: Particles vibrate about fixed positions but do not move freely.

- Gases:

- Particle arrangement: Particles are far apart with no fixed arrangement.
- Movement: Particles move rapidly and randomly, colliding elastically with each other and the container walls.
- Properties: Neither shape nor volume is fixed; gases expand to fill their containers.

Understanding these differences helps explain phenomena like diffusion, compression, and phase changes vital in physical science.

- Atoms, Elements, and Compounds

Question:

Explain the difference between an element, a compound, and a mixture, providing examples for each.

Answer:

- Element:

- Definition: A pure substance consisting of only one type of atom.

- Example: Hydrogen (H), Oxygen (O), Gold (Au).

Recognizing these differences is fundamental when studying chemical reactions and material properties in physical science.

- Motion and Force

Question:

State Newton's three laws of motion and give an example of each.

Answer:

Newton's First Law (Law of Inertia):

- Statement: An object remains at rest or moves in a straight line at constant speed unless acted

upon by an external force.

- Example: A book resting on a table stays at rest until pushed.

Newton's Second Law:

- Statement: The acceleration of an object is directly proportional to the net force acting upon it and inversely proportional to its mass ($F=ma$).
- Example: Pushing a shopping cart accelerates it; the harder you push, the faster it moves, but a heavier cart accelerates less under the same force.

Newton's Third Law:

- Statement: For every action, there is an equal and opposite reaction.
- Example: When you jump off a boat, you push down on the boat, and the boat moves backward.

Understanding these laws helps explain everyday phenomena such as vehicle motion, sports dynamics, and safety mechanisms.

- Work, Energy, and Power

Question:

Define work, energy, and power, and explain how they are related.

Answer:

- Work:
 - Definition: The transfer of energy when a force causes an object to move in the direction of the force.
 - Mathematical expression: $\text{Work} = \text{Force} \times \text{Distance} \times \cos\theta$.
 - Example: Lifting a box to a shelf.
- Energy:
 - Definition: The capacity to do work.
 - Types: Kinetic energy (motion), potential energy (position).
 - Example: A moving car (kinetic), a stretched spring (potential).

- Power:
- Definition: The rate at which work is done or energy is transferred.
- Mathematical expression: $\text{Power} = \text{Work done} / \text{Time taken}$.
- Example: A motor doing work faster has higher power.

Relationship:

Energy is the capacity to do work, and power indicates how quickly this work is performed. Understanding these concepts enables students to analyze energy efficiency, mechanical systems, and real-world applications like engines and machines.
