Detailed Solutions to Chapter 3 Exercises

Below, we present comprehensive, step-by-step solutions to typical exercises from Chapter 3.

These solutions are designed to be clear and informative, aiding students in mastering the chapter.

Exercise 3.1: Multiple Choice Questions (MCQs)

Question 1:

Which of the following is true about atoms?

- a) They are indivisible and indestructible.
- b) They are divisible into smaller particles.
- c) They are created and destroyed in chemical reactions.
- d) They are always moving at the speed of light.

Solution:

The correct answer is a) They are indivisible and indestructible (according to Dalton's atomic theory).

Atoms are considered the basic building blocks of matter and are indivisible in chemical reactions. Modern physics has shown atoms can be divided into subatomic particles, but in the context of basic chemistry and NCERT syllabus, atoms are regarded as indivisible units.

Exercise 3.2: Numerical Problems

Question 1:

Calculate the number of molecules in 18 grams of water (H_2O). (Atomic masses: $H = 1$, $O = 16$)

Solution:

Step 1: Calculate molar mass of water.

Molar mass of $H_2O = (2 \times 1) + 16 = 18 \text{ g/mol}$

Step 2: Determine moles of water.

Number of moles = mass / molar mass = $18 \text{ g} / 18 \text{ g/mol} = 1 \text{ mol}$

Step 3: Use Avogadro's number to find molecules.

Number of molecules = number of moles $\times$ Avogadro's number

= 1 mol $\times$ 6.022×10^{23} molecules/mol

= 6.022×10^{23} molecules

Answer:

There are approximately 6.022×10^{23} molecules in 18 grams of water.

Exercise 3.3: Conceptual Questions

Question 1:

Explain the difference between an atom and a molecule.

Solution:

An atom is the smallest unit of an element that retains the chemical properties of that element. It consists of protons, neutrons, and electrons.

A molecule is formed when two or more atoms chemically combine. Molecules can consist of atoms of the same element (e.g., O_2) or different elements (e.g., H_2O).

Key Differences:

- Atoms are single units; molecules are groups of atoms bonded together.
- Molecules can be composed of multiple atoms; atoms are the fundamental units of elements.
- Molecules can be diatomic or polyatomic, whereas atoms are singular units.

Exercise 3.4: Short Answer Questions

Question 1:

Derive the empirical formula of a compound that contains 40% carbon and 60% oxygen by mass.

Solution:

Step 1: Assume 100 g of the compound.

- Carbon: 40 g
- Oxygen: 60 g

Step 2: Convert masses to moles.

- Moles of carbon = $40 \text{ g} / 12 \text{ g/mol} = 3.33 \text{ mol}$
- Moles of oxygen = $60 \text{ g} / 16 \text{ g/mol} = 3.75 \text{ mol}$

Step 3: Find the simplest ratio.

Divide both by the smaller number (3.33):

- Carbon: $3.33 / 3.33 = 1$
- Oxygen: $3.75 / 3.33 \approx 1.13$

Step 4: Approximate to whole numbers.

Since $1.13 \approx 1.13$, multiply both by 7 to get whole numbers:

- Carbon: $1 \times 7 = 7$
- Oxygen: $1.13 \times 7 \approx 8$

Final ratio: C₇O₈

Empirical formula: C₇O₈

Sample Objective Questions with Explanations

Example 1: Organic Chemistry

Question: Which of the following compounds is aromatic?

- a) Cyclohexane
- b) Benzene
- c) Cyclohexene
- d) Cyclobutadiene

Answer: b) Benzene

Explanation: Benzene is aromatic due to its planar structure with delocalized π -electrons satisfying Huckel's rule ($4n + 2$ π -electrons, where $n=1$). Cyclohexane is saturated and non-aromatic, cyclohexene contains a double bond but is not fully aromatic, and cyclobutadiene is anti-aromatic.

Example 2: Physical Chemistry

Question: The rate constant of a reaction doubles when the temperature increases from 300 K to 310 K. Which of the following is likely true?

- a) The activation energy is very high.
- b) The reaction has a low activation energy.
- c) The reaction is exothermic.
- d) The rate law is zero order.

Answer: a) The activation energy is very high.

Explanation: According to the Arrhenius equation, the rate constant's sensitivity to temperature increases with higher activation energy. A doubling of rate constant over a 10 K increase suggests a relatively high activation barrier.

Example 3: Inorganic Chemistry

Question: The oxide that reacts with both acids and bases is called a/an _____ oxide.

- a) Acidic
- b) Basic
- c) Amphoteric
- d) Neutral

Answer: c) Amphoteric

Explanation: Amphoteric oxides, such as Al_2O_3 and ZnO , react with both acids and bases, displaying dual behavior.

Conclusion: The Significance of Objective Questions in Chemistry Education

Objective questions form an integral part of chemistry education at the Class XII level. They serve as a robust tool for testing a wide array of skills—from rote memorization to higher-order analytical

thinking. Their strategic design and effective practice can significantly enhance students' conceptual understanding, exam readiness, and problem-solving skills.

For educators, developing well-balanced objective question sets aligned with the syllabus ensures comprehensive coverage and fair evaluation. For students, mastering these questions through consistent practice, conceptual clarity, and strategic approaches can make the difference between average and excellent performance.

Ultimately, objective questions are not merely a testing tool but a gateway to mastering chemistry fundamentals, preparing students for future academic pursuits and competitive examinations. By appreciating their structure, purpose, and best practices for preparation, students and teachers can turn these questions into powerful catalysts for learning and academic success.
