Dans cet article, nous explorerons en détail comment développer avec SharePoint 2010 en .NET pour des applications personnalisées, en abordant les concepts fondamentaux, les outils nécessaires, les meilleures pratiques et des exemples concrets pour vous aider à tirer le meilleur parti de cette plateforme.

Introduction à SharePoint 2010 et son développement en .NET

SharePoint 2010 est une plateforme collaborative de Microsoft conçue pour gérer le contenu, automatiser les workflows et favoriser la communication interne. Sa compatibilité avec le développement en .NET permet aux développeurs de créer des solutions riches, intégrant des fonctionnalités avancées et une expérience utilisateur fluide.

Le développement en .NET pour SharePoint 2010 repose essentiellement sur l'utilisation de Visual Studio, du modèle objet SharePoint (SharePoint Object Model), ainsi que sur des composants comme les Web Parts, les listes, les workflows et les services.

Les outils nécessaires pour développer avec SharePoint 2010 en .NET

Environnement de développement

Pour commencer à développer avec SharePoint 2010, il est essentiel d'avoir un environnement adéquat :

- Visual Studio 2010 ou une version compatible avec SharePoint 2010
- SharePoint 2010 installé en tant que serveur de développement (ou une machine virtuelle pour le développement local)

- .NET Framework 3.5, qui est la version supportée par SharePoint 2010

Outils complémentaires

- SharePoint Designer 2010 pour la personnalisation rapide
- SharePoint SDK (Software Development Kit) pour accéder à la documentation et aux modèles

Les concepts clés du développement en .NET pour SharePoint 2010

Web Parts

Les Web Parts sont des composants modulaires qui s'intègrent dans les pages SharePoint pour afficher du contenu ou fournir des fonctionnalités interactives. En développement .NET, vous pouvez créer des Web Parts personnalisés pour répondre aux besoins spécifiques de votre organisation.

Listes et bibliothèques

Les listes sont des structures de stockage de données dans SharePoint. Développer des applications permet d'interagir avec ces listes via le modèle objet, en créant, modifiant ou supprimant des éléments selon la logique métier.

Workflows

Les workflows automatisent les processus métier, comme la validation de documents ou l'approbation de demandes. SharePoint 2010 supporte les workflows en utilisant Windows Workflow Foundation (WF), que vous pouvez personnaliser via Visual Studio.

Event Receivers et Timer Jobs

Les Event Receivers permettent de réagir aux événements de la plateforme, comme l'ajout ou la suppression d'éléments dans une liste. Les Timer Jobs sont des tâches planifiées exécutées périodiquement pour effectuer des opérations en arrière-plan.

Développement d'applications SharePoint 2010 en .NET : étapes clés

1. Création du projet dans Visual Studio

Pour développer une solution SharePoint, commencez par créer un projet de type « SharePoint 2010 Empty Project » ou « Sequential Workflow » selon le besoin.

2. Configuration du projet

Définissez les paramètres du projet, notamment :

- Le type de solution (Web Part, Event Receiver, Workflow, etc.)
- Les références aux assemblies SharePoint
- Les propriétés de déploiement

3. Développement du composant

Selon votre choix, développez le Web Part, le workflow ou autre composant en utilisant le modèle objet SharePoint. Cela implique souvent l'écriture de code C pour manipuler les objets API, gérer les événements ou automatiser les processus.

4. Test et débogage

Utilisez l'environnement de développement pour tester localement. SharePoint 2010 doit être configuré pour permettre le débogage à distance ou en local avec l'intégration de Visual Studio.

5. Déploiement

Une fois le développement terminé, déployez la solution via le gestionnaire de solutions SharePoint, en utilisant des fichiers .wsp (SharePoint Solution Package). Ce processus implique l'installation, l'activation et la vérification du bon fonctionnement.

Meilleures pratiques pour le développement SharePoint 2010 en .NET

1. Utiliser des modèles et des cadres standards

Adoptez les bonnes pratiques de développement en utilisant des modèles réutilisables, ce qui facilite la maintenance et la scalabilité.

2. Gérer les déploiements avec soin

Les solutions SharePoint peuvent affecter l'environnement global. Utilisez des packages de solutions pour gérer proprement les déploiements, mises à jour et désinstallations.

3. Optimiser la performance

Évitez les accès excessifs aux bases de données ou aux services externes. Cachez les données

lorsque cela est possible et utilisez les techniques de pagination pour les listes volumineuses.

4. Respecter la sécurité

Vérifiez les permissions et sécurisez votre code pour éviter les vulnérabilités potentielles. Utilisez les API côté serveur et évitez d'exposer des composants sensibles côté client.

5. Documenter le code

Une documentation claire facilite la maintenance et la prise en charge par d'autres développeurs ou administrateurs.

Exemples concrets de développement en .NET pour SharePoint 2010

Créer une Web Part personnalisée

Voici un aperçu des étapes pour créer une Web Part en C :

- Créer un nouveau projet de Web Part dans Visual Studio
- Hériter de la classe WebPart
- Redéfinir la méthode CreateChildControls() pour ajouter du contenu dynamique
- Compiler le projet et générer un fichier .wsp
- Déployer la solution dans SharePoint et ajouter la Web Part à une page

Automatiser un workflow avec Visual Studio

Pour créer un workflow personnalisé :

- Créer un projet de workflow dans Visual Studio
- Utiliser Windows Workflow Foundation pour définir le processus
- Ajouter des activités personnalisées ou prédéfinies pour gérer chaque étape
- Déployer le workflow sur la plateforme SharePoint

Interagir avec une liste SharePoint via le modèle objet

Voici un exemple simple de code C pour ajouter un élément à une liste :

```
using Microsoft.SharePoint;
```

```
string siteUrl = "http://votresite";

string listName = "Documents";

using (SPSite site = new SPSite(siteUrl))

{

    using (SPWeb web = site.OpenWeb())

    {

        SPList list = web.Lists[listName];

        SPListItem newItem = list.AddItem();

        newItem["Title"] = "Nouveau document";

        newItem.Update();

    }

}
```

Conclusion

Développer avec SharePoint 2010 en .NET offre une flexibilité exceptionnelle pour créer des solutions sur mesure qui améliorent la productivité et la collaboration au sein des organisations. En maîtrisant les outils, les concepts clés et en suivant les meilleures pratiques, vous pouvez concevoir des applications robustes, performantes et sécurisées.
