Sample Questions with Detailed Answers and Explanations

Let's examine some representative questions you might encounter on the EOC, along with comprehensive answers.

Question 1: What is the primary cause of the Earth's seasons?

Answer: The tilt of Earth's rotational axis relative to its orbital plane causes the seasons. When the Northern Hemisphere tilts toward the Sun, it experiences summer; when it tilts away, it experiences winter.

Explanation: Earth's axis is tilted approximately 23.5 degrees from perpendicular to its orbit. This tilt results in varying angles and intensities of sunlight throughout the year, leading to seasonal changes. During summer in the Northern Hemisphere, the Sun's rays strike the area more directly, increasing temperatures. Conversely, during winter, the rays are less direct, and days are shorter.

Question 2: Which planet is known for having a prominent ring system?

Answer: Saturn

Explanation: Saturn is famous for its extensive and visually striking ring system composed of ice particles, rock, and dust. While other gas giants like Jupiter, Uranus, and Neptune also have ring systems, Saturn's rings are the most prominent and easily observable.

Question 3: Interpret the graph showing the water cycle. If the graph indicates increased evaporation rates, what is a likely consequence?

Answer: Increased evaporation can lead to higher humidity levels, potentially resulting in more cloud formation and increased chances of precipitation.

Explanation: The water cycle involves evaporation (water turning into vapor), condensation (vapor forming clouds), and precipitation. When evaporation rates increase, more water vapor enters the atmosphere, which can lead to more cloud development and, under suitable conditions, more rainfall.

Question 4: Describe how the movement of Earth's tectonic plates can cause volcanic activity.

Answer: When tectonic plates diverge at divergent boundaries, magma from the mantle rises to fill the gap, creating new crust and potentially causing volcanic eruptions. Similarly, at convergent boundaries, plates collide, causing subduction and melting of mantle material, which can also produce volcanoes.

Explanation: Plate boundaries are zones of intense geological activity. Divergent boundaries (such as mid-ocean ridges) allow magma to ascend, forming new crust and volcanic features. Convergent boundaries (like the Pacific Plate and North American Plate collision) lead to subduction zones where one plate sinks beneath another, melting and generating magma that can result in volcanic eruptions.
